## Ans-1 Minimum Spanning Tree

A Spanning Tree of an undirected graph is a subgraph that is a tree and joined by all vertices. One of those trees which has minimum total cost would be its minimum spanning tree.

- It has direct application in the design of network including to computer network, telecommunication network, transportation network etc.

## Ans-3

min weight = 37

Ans-4 i if 10 unit is added to each edge, the overall weight of the path may change

Shortest Path  $s \rightarrow a \rightarrow b \rightarrow c \rightarrow d$  with min weight = 4

Shortest Path  $s \rightarrow d \rightarrow c$  with min weight = 28

ii multiplying the weight of each edge by 10 unit will have no impact on shortest path.
